Sustainability and Innovation Policy

OUR VISION

At DT Infrastructure, we are committed to building infrastructure that creates lasting value for our clients, communities and the environment.

We integrate sustainability and innovation into every aspect of project delivery. We do this by minimising environmental impacts, creating positive social and economic outcomes, embracing innovative solutions, and continually improving the way we work.

Sustainability and innovation enable us to deliver infrastructure that is responsible, resilient and ready for the future.

For the purpose of this policy, DT Infrastructure includes DT Infrastructure Pty Ltd and its controlled entities.

OUR APPROACH

We promote a culture where:

- Sustainability risks, opportunities, dependencies and impacts are considered when making strategic, commercial and project decisions.
- We support the transition to lower-carbon and climate-resilient infrastructure by reducing operational and embodied greenhouse gas emissions where practicable.
- Resources are used responsibly through efficient energy, water and material use, waste minimisation and circular economy principles.
- We explore and apply new technologies, digital solutions, materials, construction methods and alternative energy solutions that improve project outcomes.
- We create positive social outcomes through inclusive workplaces, local employment, skills development and responsible procurement.
- Collaboration with clients, delivery partners, suppliers, research institutions and industry bodies occurs to improve sustainability and innovation outcomes.
- We continuously improve our sustainability and innovation performance by monitoring outcomes, sharing knowledge and applying lessons learned across our business.

Together, these principles help us deliver infrastructure that creates enduring value for our people, clients, communities and future generations.
